

IN THE SPECIFICATION:

Please amend the second paragraph on page 3 as follows:

Disposed around the pipe 12 and extending into the recess 23 on the support plate 16 is a screw-threaded element in the form of a nut 22 with an inwardly extending flange 25 at one end. The flange 25 is captively received between the radial face 27 and the flange 19, so that the nut 22 cannot move any substantial distance length-wise of the pipe 12, but can rotate therearound. The surface of the nut 22, outside the recess 23 is, for example, hexagon-shaped for engagement with a spanner to allow a user to rotate the nut 22. The nut 22 ~~is internally threaded at this end~~includes internal threads 24.

Please amend the second full paragraph on page 4:

A cover member in the form of a cover plate ~~36~~35, e.g. of a plastics material, is snap-fitted to the support plate 16 to conceal the assembly therebeneath.
